2025

Data Center Energy Storage Industry Insights Report

# **Executive Summary**

As the data center industry continues to evolve, energy storage remains a critical focus, shaped by shifting priorities, emerging technologies, and the growing demands of AI, among other challenges. Conducted by Endeavor Business Intelligence on behalf of ZincFive, this report presents insights from 132 global industry professionals, examining current usage trends, key priorities, and evolving perceptions of energy storage. These findings provide a clear view of the industry's trajectory and the innovations set to define its future.

#### Key Findings and Trends

- Al's Biggest Impact: When asked about Al's effect on power and energy storage, 55% of respondents cited increased energy efficiency requirements, while 54% emphasized the growing need for higher power density and smaller footprints.
- Drivers for Change: Cost remains the primary driver for changes in energy storage technology (58%), followed by safety concerns (46%), cooling requirements (42%), product availability (40%), and reliability issues (39%).
- **Sustainability:** In 2025, sustainability continues to gain importance, with 87% of respondents considering it a priority, up from 81% in 2024. Additionally, nearly three-quarters (72%) report significant or moderate cost reductions from their organization's sustainability efforts, an increase from 63% last year.
- Backup Runtimes: In 2025, 37% of respondents expect their UPS battery backup run times to decrease in the future, a notable rise from 26% in 2024. Meanwhile, 31% anticipate no change, down from 38% last year.
- **Modular Power Solutions:** Two-thirds (68%) of respondents use modular power solutions and plan to continue, 22% deploy them at all locations, while 14% have no plans for adoption.

The data center energy storage landscape is rapidly evolving, shaped by shifting priorities, emerging technologies, and growing AI demands. Industry professionals cite power availability, cybersecurity and data privacy, sustainability, cooling, and AI as the biggest challenges of the next decade. At the same time, declining trust in existing UPS systems and expectations of shorter runtimes underscore the need for more reliable, adaptable energy storage solutions.

Al is fundamentally reshaping data center operations, driving higher power demands, evolving infrastructure needs, and a shift away from traditional power management strategies. Respondents identified two key impacts: increasing energy efficiency requirements (55%) and the need for higher power density with smaller footprints (54%). These demands are fueling the rise of customized and modular power solutions, which offer flexibility, scalability, and rapid deployment to address power constraints and accelerated build timelines.

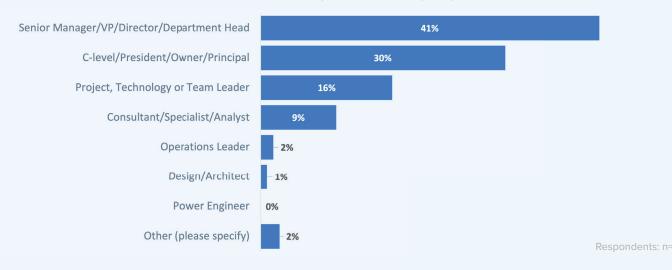

Cooling strategies are also adapting to Al-driven workloads. Many respondents emphasized the need for hybrid cooling systems with multiple layers of redundancy – such as air, water, and redundant cooling loops – to mitigate first-line failures. Al-driven monitoring for optimization and predictive maintenance is becoming a key consideration in these strategies.

Finally, newer battery chemistries are gaining traction, offering a combination of benefits that align with data center operators' evolving priorities. As Al adoption accelerates and infrastructure challenges grow, the industry is shifting toward more innovative, efficient, and resilient energy storage solutions.

# **Demographics**

### **Respondent Demographics**

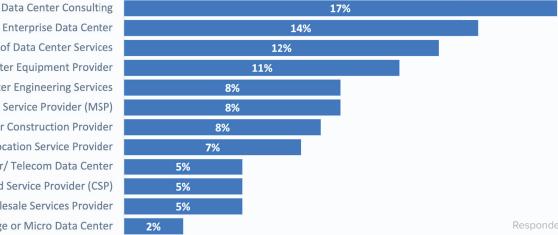

Two in five respondents (41%) identified as a senior manager, VP, director or department head, followed by C-level (3%) and project, technology or team leader (16%).

#### Which of the following best describes your job level?

### **Organizational Demographics**

Nearly one in five respondent organizations (17%) is best described as data center consulting, followed by enterprise data center (14%), data center customer (12%), and data center equipment provider (11%).

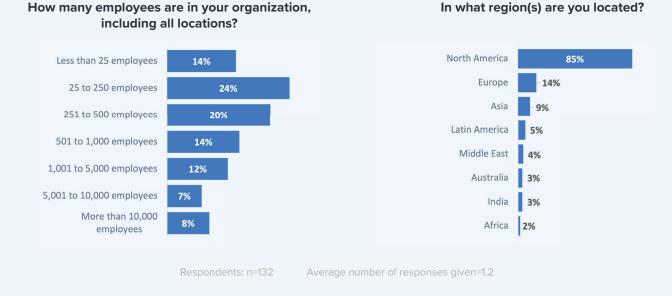

#### Which of the following best describes your organization?

**Enterprise Data Center Customer of Data Center Services** Data Center Equipment Provider Data Center Engineering Services Managed Service Provider (MSP) **Data Center Construction Provider Colocation Service Provider** Carrier/ Telecom Data Center Cloud Service Provider (CSP) Wholesale Services Provider Edge or Micro Data Center

Respondents: n=132

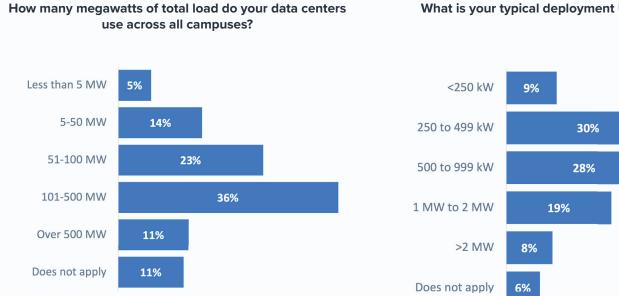

### **Data Center Demographics**

Three in five (58%) respondent organizations had 500 or fewer employees, with a guarter (24%) having between 25 to 250 employees across all locations. Four in five respondent organizations (85%) had a location in North America.

### **Data Center Demographics**

More than a third (36%) of respondents say their organization uses 101-500 MW of total load across all campuses. Three in ten (30%) say their typical deployment UPS size is 250 to 499 kW, followed by 500 to 999 kW (28%).

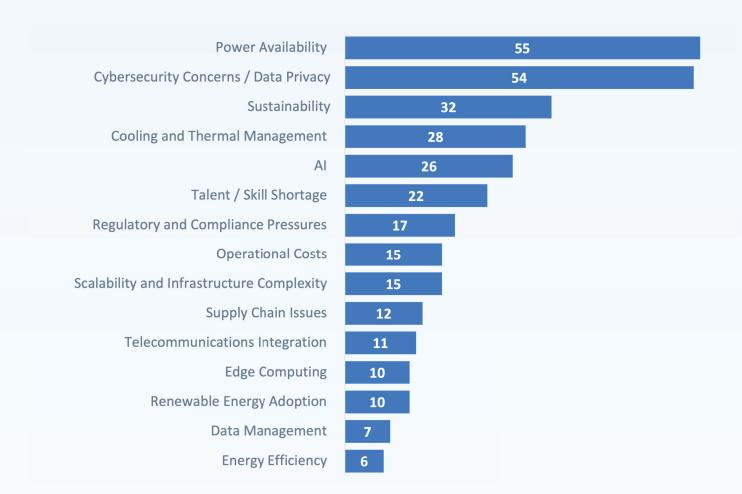

What is your typical deployment UPS size?

# **Evolving Challenges in Data Centers**

### **Challenges Impacting the Data Center Industry**

When asked about the biggest challenges shaping the data center industry over the next decade, respondents identified power availability, cybersecurity and data privacy, sustainability, cooling, and AI as the top concerns.

Which 3 challenges do you foresee having the greatest impact on the data center industry in the next 10 years? (open end)

Number of responses to an open-ended question Respondents: n=132

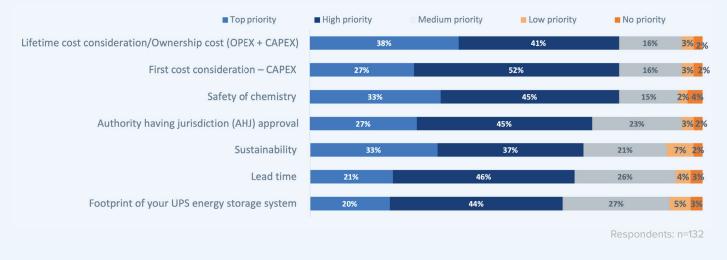

The 15 most frequently mentioned answers are featured

# **Energy Storage Solutions**

### **Energy Storage Solution Feature Priorities**

Lifetime cost remains a key factor, with 79% of respondents ranking it as a top or high priority. Safety and sustainability also hold strong importance, cited by 79% and 70% of respondents, respectively. These priorities continue to lead the way, consistent with findings from the 2024 report.

## When selecting an energy storage solution, what priority does your organization place on the following features?

### Safety

When it comes to safety, seven in ten (70%) rate LFP batteries as good (Excellent + Very Good + Good), followed by VRLA at 63%.

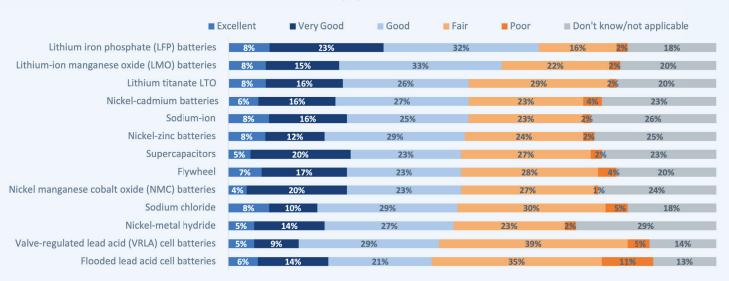

#### Please rate each battery type based on SAFETY

<b>E</b>	Excellent	Very Good	Good	Fair	Poor	Do	on't know	/not applic	able
Lithium iron phosphate (LFP) batteries	16%	2!	5%		29%		10% 2	<mark>%</mark> 18	%
Valve-regulated lead acid (VRLA) cell batteries	6%	26%		31%		2	0%	3%	14%
Flywheel	11%	24%		27%		13%	5%	20%	0
Lithium titanate LTO	12%	23%		27%		14%	2%	22%	
Lithium-ion manganese oxide (LMO) batteries	7%	18%	3	6%		17%	2%	21%	
Nickel manganese cobalt oxide (NMC) batteries	4%	17%	37%			17%	2%	23%	
Sodium chloride	11%	23%		23%		19%	5%	19	%
Supercapacitors	11%	19%		26%	1	6%	<mark>4%</mark>	24%	
Nickel-zinc batteries	8%	15%	31%		17%	5 29	6	27%	
Sodium-ion	11%	16%	26%		16%	4%		28%	
Flooded lead acid cell batteries	3% 149	%	34%			30%		7%	13%
Nickel-metal hydride	8%	14%	27%		18%	4%		30%	
Nickel-cadmium batteries	8%	17%	22%		23%	5%	6	26%	

Respondents: n=132

### Footprint

When it comes to footprint, two-thirds (63%) rate LFP batteries as good (Excellent + Very Good + Good), followed by LMO batteries at 56%.

#### Please rate each battery type based on FOOTPRINT

Respondents: n=132

### **Sustainability**

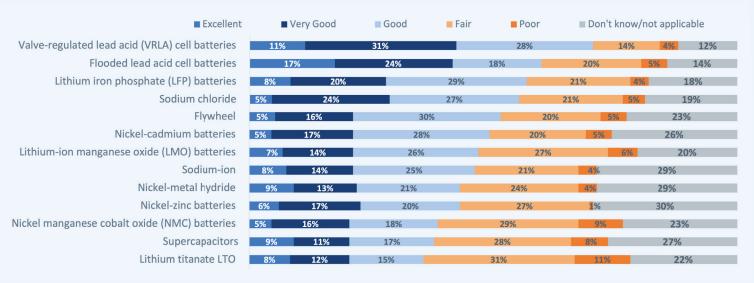

When it comes to sustainability, two-thirds (65%) rate LFP batteries as good (Excellent + Very Good + Good), followed by flywheel at 59%.

#### Please rate each battery type based on SUSTAINABILITY

Exce	lent	Very Good	Good	Fair	Poor	■ Don't	know/no	ot applicable
Lithium iron phosphate (LFP) batteries	8%	24%		33%	l.	11%	4%	20%
Flywheel	16	5%	22%	21%		17%	3%	21%
Lithium titanate LTO	7%	21%		29%		22%	2%	20%
Lithium-ion manganese oxide (LMO) batteries	6%	16%	3	5%		18%	3%	22%
Sodium chloride	5%	26%		26%	1	.9%	5%	20%
Supercapacitors	11%	19%		25%	17%	3%		25%
Nickel-zinc batteries	2%	17%	31%		19%	4%		28%
Sodium-ion	10%	14%	26%		20%	<mark>2</mark> %		29%
Nickel-metal hydride	3%	16%	30%		19%	2%		30%
Nickel-cadmium batteries	8%	11%	26%		21%	9%		24%
Valve-regulated lead acid (VRLA) cell batteries	6%	11%	28%		37%	5	4	14%
Nickel manganese cobalt oxide (NMC) batteries	7%	10%	27%		29%	3%		25%
Flooded lead acid cell batteries	7%	12%	19%		35%		14%	14%

### Cost

When it comes to cost, seven in ten respondents (70%) rate VRLA cell batteries as good (Excellent + Very Good + Good), followed by flooded lead acid cell batteries at 59%.

#### Please rate each battery type based on COST

Respondents: n=132

### **Changes in Energy Storage Technology**

Cost (58%) is the biggest driver of change in energy storage technology, followed by safety concerns (46%), cooling requirements (42%), product availability (40%), and reliability issues (39%).

## Which of the following are driving the changes you are considering to your energy storage technology?

Cost	58	8%
Safety concerns	46%	
Cooling requirements	42%	
Product availability	40%	
Reliability issues	39%	
Sustainability targets/mandates	36%	
Regulatory changes (e.g., codes and standards)	32%	
Lack of floor space	31%	
The transition from centralized to distributed UPS or energy	24%	
Ethical material use	23%	
Participation in utility demand management programs	14%	
Other (please specify)	0%	
We are not considering changes in energy storage	5%	Re

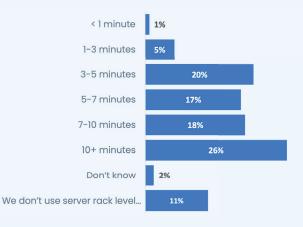

### **UPS Battery Backup Run Times**

Five minutes or less—that's the battery backup run time for 19% of respondents using centralized UPS and 26% at the server rack level. Meanwhile, more than a third (36%) of centralized UPS users report run times of 10+ minutes, with the same extended duration noted by 26% of respondents at the server rack level.

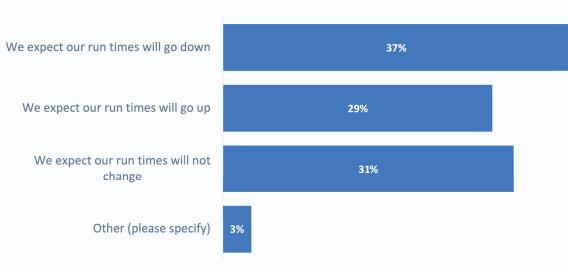

If you use server rack level battery backup (BBU), what are your backup run times?

Respondents: n=132

### Shifts in UPS Battery Backup Run Times

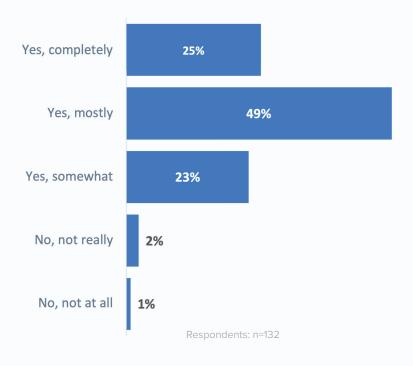

In 2025, nearly two in five (37%) expect their UPS battery backup run times to go down in the future, up noticeably from last year (26%). Nearly a third (31%) say they expect run times won't change, down from 38% in 2024.

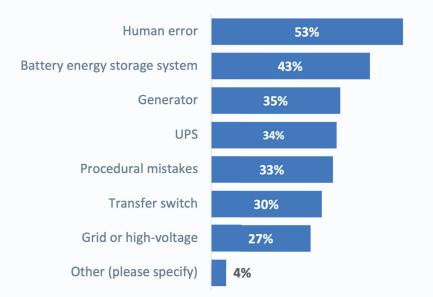

### **Trust in UPS Backup Systems and Potential Failure Points**

Confidence in the reliability of existing UPS backup systems has declined since 2024. In 2025, only 25% of respondents say they completely trust their current UPS backup system—a drop from 34% the previous year. Among those who did not completely trust their backup systems, both 2024 and 2025 show that participants believe that the biggest potential failure point in their system is human error (57% in 2024 and 53% in 2025).

#### Do you trust your existing UPS backup system?

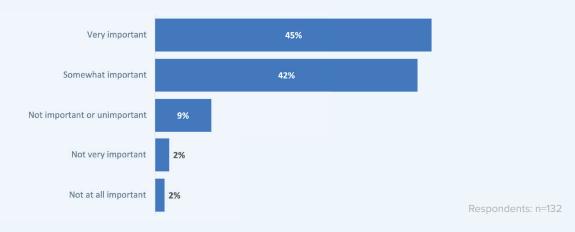

Respondents who did not say"Yes, completely" n=99 Average number of responses given=2.6

# Sustainability

### **Sustainability's Role in Buying Decisions**

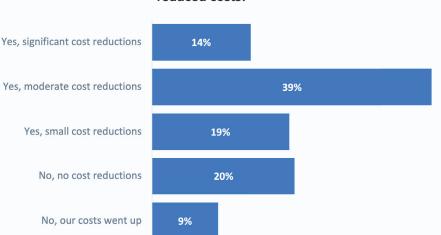

In 2025, sustainability remains a growing priority, with 87% of respondents considering it important (very important + somewhat important), up from 81% in 2024.

## How important are sustainability criteria in your power system buying decisions?

### **Cost Savings from Sustainability Initiatives**

In 2025, nearly three-quarters of respondents (72%) report significant or moderate cost reductions from their organization's sustainability efforts, up from 63% in 2024.

## Have your organization's sustainability programs/efforts resulted in reduced costs?

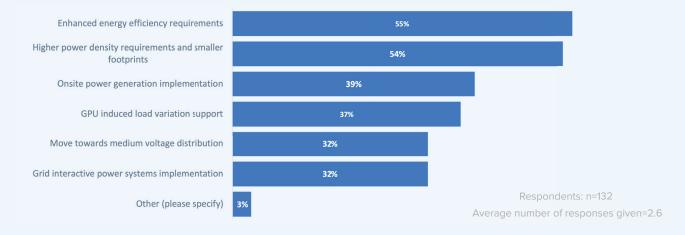

Respondents: n=132

# **Artificial Intelligence**

### Al's Biggest Impact on Data Center Power and Energy Storage

Half of the respondents say the biggest impacts of AI on power requirements and energy storage technology will be enhanced energy efficiency requirements (55%) as well as higher power density requirements and smaller footprints (54%).

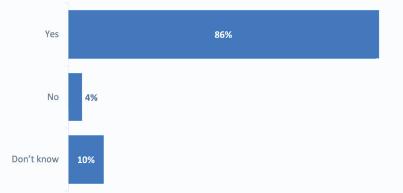

## What is the biggest impact on power requirements and energy storage technology artificial intelligence (AI) will have on your data center?

### The Shift Toward Customized Power Designs for AI

Nearly nine in ten respondents (86%) anticipate a shift toward more customized power designs to meet AI demands, while only 4% expect no changes.

# **Modular Power Solutions**

### **Modular Power Solutions Usage**

Two-thirds of respondents (68%) say their organization is currently utilizing modular power solutions and will continue to do so, with one in five (22%) saying it is used at all locations. Just over one in ten (14%) have no plans to use modular power solutions in the future.

How is your organization currently utilizing modular (containerized or skid-mounted) power solutions?

Respondents: n=132

#### QUESTION

# Which 3 challenges do you foresee having the greatest impact on the data center industry in the next 10 years? First challenge (open end)

ANSWERS

5G and Telecommunications Integration Adopting new tools/approaches Al

AI

AI

AI Infrastructure

Al, cloud, and IoT are driving unprecedented power demands.

Artificial intelligence

As users demand faster access to data and applications, data centers need to minimize latency.

Availability of power for market expansion

Balancing upfront capital expenditures with operational expenses

blockchain

Budgets

Capacity range

Carbon Footprint

Carbon Footprint

**Carbon Footprint Reduction** 

Challenges with power and cooling as adoption of energy efficient hardware is still slow

Changing/Evolving ITE Load Profiles

Chip performance

Companies will need to balance cost efficiency with sustainability and performance demands.

Cooling

Cooling

Cooling

Cooling and Heat Management

Cooling and Thermal management

Cooling Efficiency

Cooling Fluids and Environmentally

**Friendly Practices** 

Cybersecurity

Cybersecurity & Data Privacy Risks

Cybersecurity issues

Cybersecurity Privacy

Cybersecurity threats

Data compression

Data Explosion

Data Privacy and Security

Data Privacy and Security

Data Security

Data Security

Data Security

Disaster Recovery and Business Continuity

#### Edge Computing Growth

Emerging or disruptive technology

Energy availability

energy consumption

energy consumption

Energy Consumption and Sustainability

Energy Consumption and Sustainability

Energy consumption growth

Energy consumption in data centers is a challenge, and the need to adopt renewable energy is key

Energy creation and grid access

Energy efficiency

Energy Efficiency and Sustainability

Energy Efficiency and Sustainability

Energy Efficiency and Sustainability

Energy Efficiency and Sustainability

Energy Sustainability

Ensuring cost-effective procurement of hardware and software.

Ensuring low-latency connections across vast geographic areas.

Ensuring the agility and flexibility of IT resources

Growing Utilization of Energy

I think there will be an increased market competition

#### QUESTION / CONTINUED

# Which 3 challenges do you foresee having the greatest impact on the data center industry in the next 10 years? First challenge (open end)

ANSWERS

Highly qualified staff will be needed due to the growing complexity of data center operations.

I think an increased competition in the data center market will pressure pricing and service offerings.

I think there will be skill shortages because in recent times, there have been a growing need for skilled professionals in the data center sector.

I think with the rapid growth of cloud computing and the Internet of Things (IoT), data centers will need to be more scalable and flexible to accommodate fluctuating demands.

Increase cyber threats, ransomware attacks

Increased energy consumption

Increasing energy

Increasing energy demands and sustainability concerns

Infrastructure Limitation

Infrastructure Limitation

Infrastructure Limitation

LA SEGURIDAD DE LOS DATOS

labor

Latency and growth of edge

Limited availability of renewable energy sources

Liquid cooling

Maintenance

Managing global supply chain issues for hardware components

#### Managing hardware lifecycle

Modular data centers

One challenge could be Energy Efficiency. As demand for data centers grows, improving energy efficiency will be crucial to reduce operational costs and environmental impact.

Power

Power

Power

Power availability

Power availability

Power availability

Power availability from grid

Power Costs

Power equality

Power requirements

Power Supply & Reliability

Prevention of data breaches

Procurement / Supply Chain

procuring plant and equipment

Protecting sensitive data

**Regulatory and Compliance Pressures** 

**Regulatory Compliance** 

Reliability

resilience

Rise of edge computing the require for a little localized data centers near end users will rise as IoT.

Rising energy consumption

Rising operational cost

Rising power demands will challenge sustainability efforts.

Security and Data

Security is the big one. Hackers are getting smarter and are making money out of data so it is become more and more of a target when data in consolidated in our data centers

Security threats

shortage of skilled workers

Specialized hardware will be necessary for

Striking a balance between scalability and energy consumption.

Supply chain disruptions

Sustainability

Sustainability

Sustainability and Energy consumption

Tackling the vulnerabilities introduced by IoT devices connected to data centers.

Technology

The complexity of handling hybrid-cloud environments.

#### QUESTION / CONTINUED

# Which 3 challenges do you foresee having the greatest impact on the data center industry in the next 10 years? First challenge (open end)

ANSWERS

#### The continuous increase of cybersecurity threats

The growth of AI and GenAI

the move to liquid cooling

The rollout of 5G will impact data center

The rollout of 5G will impact data center

The rollout of 5G will impact data center design and operations.

#### Thermal cooling

Tough cooling requirements

Transmission Lines

Use Al-powered detection of threats and negotiate around tight regulations.

utility power

Viruses / Malware

Well, I think a global supply chain issues can affect hardware availability and lead times, impacting data center operations.

#### QUESTION

# Which 3 challenges do you foresee having the greatest impact on the data center industry in the next 10 years? Second challenge (open end)

ANSWERS

Addressing bottlenecks in cross-data-center connectivity.

advocate for stronger efficiency standards and emission-free regulations.

AI

5G

AI

ΔI

AI & Automation Adoption

AI & Automation integration

Al and high-speed computing demand huge quantities of processing power, necessitating more effective server structures.

#### AI Complexity

Al development

Al training models require massive computational power, increasing the strain on data center resources.

Algorithm calculations

Another challenge I could think of would be security threats. Data centers must invest heavily in security to protect their data.

Automating data center expansion and upgrades.

Available energy

Blockchain and Data Integrity

bugs due to technology advancement

Carbon emission control

Challenges pertaining to supply chain of essential equipment Cloud Provider Dominance Confidential Computing

Cooling costs

Chain supplier

Cooling Technology

Cooling technology adoption

Cost management will be a challenge too because managing costs effectively while maintaining service quality will be a constant challenge.

Cost-effective energy storage solutions to ensure round-the-clock operations.

QUESTION / CONTINUED

# Which 3 challenges do you foresee having the greatest impact on the data center industry in the next 10 years? Second challenge (open end)

ANSWERS

### Cost-effective scaling of server and storage capabilities

Cyber security with new technology

Cybersecurity

Cybersecurity

Cybersecurity Threats

Cybersecurity threats due to growing data volumes and sophistication of attacks

Data centers consume massive amount of electricity.

data centers to be highly scalable

Data Privacy

Efficiency

#### Efficiency

Efficiency and energy usage. These data centers are massive and use tons of energy. larger centers are harder to operate

Efficient heat management will become increasingly difficult.

Energy consumption and power grid

Energy costs

Energy draw

Ensuring reliable network connections will be

Environmental impact

Environmental issues

Equipment availability

eradication of diesel generators

Government

Government sustainability regulations

Green Energy Transition

Grid energy availability

Hacking

Hacking risks will grow with evolving attack strategies.

Hardware Advances and Obsolescence

Hiring employees

Hybrid Cloud Architecture

Increasing sophistication of cyberattacks

Infrastructure complexity

Infrastructure Scalability

Interconnection and Network Performance

Keeping up with rapid technological changes such as advancements in hardware and software and infrastructural management, will be essential.

Keeping up with rapid technological changes, such as AI and machine learning integration, will require ongoing investment and adaptation.

Labor

Labor Shortages and Skilled Workforce

Lack of training for new workers

Land

Land Management

Latency and Network Performance

Latency-Sensitive Applications

Local building restrictions

long delivery times

Maintaining affordable pricing for customers amid growing demand.

Managing data sovereignty and cross-border data transfer restrictions.

Managing the cost of data transfers, especially in multi-cloud environments.

Managing the increasing complexity of data center architecture.

#### QUESTION / CONTINUED

# Which 3 challenges do you foresee having the greatest impact on the data center industry in the next 10 years? Second challenge (open end)

ANSWERS

### Meeting environmental regulations and certifications

Meeting growing customer demands for speed, reliability, and flexibility will be challenging.

mismatch of internet services to skillsets in the marketplace

Need for better UPS batteries and grid-independent storage.

network security

Our operations are growing very fast and we are experiencing challenges with data center scalability

Power

#### QUESTION / CONTINUED

# Which 3 challenges do you foresee having the greatest impact on the data center industry in the next 10 years? Third challenge (open end)

ANSWERS

Hyperscalers may disrupt traditional data center models.

In addition, traditional cooling methods may not be sufficient, leading to the need for innovative cooling technologies that can efficiently manage heat in high-density environments.

Increased cost pressures due to sustainability requirements.

Industry interruptions

Infrastructure as Code

Infrastructure demand

Infrastructure Scalability and Edge Computing

Integrating AI for operational efficiency and predictive maintenance will be necessary.

Integration of green technologies such as solar and wind.

Interoperability issues

LA VELOCIDAD CON LA CUAL SE ACCEDERAN

Latency Concerns

Liquid cooling, immersion cooling, and heat reuse strategies.

Local Power availability

Managing cooling systems efficiently to reduce energy waste

Multi-cloud places will keep growing, ensuring an easy switch between on-premises and cloud services.

New technology

Nuclear energy

OEM's supporting this market

Older employees aging out of our industry

Operating in multiple countries will require data centers to adapt to diverse regulations and market conditions.

Optimization

People / Talent

Permitting delays

Political Stability

Post Quantum Encryption & Store Now Decrypt Later (SNDL)

Power

Public outreach

Rapid improvements in software and technology could cause obsolescence to occur more quickly.

Regulations & Compliance

Regulatory pressure and compliance

Renewable energy adoption

**Rising Operational Cost** 

Rising operational costs due to increasing energy prices

Safeguarding infrastructure from insider threats

safety concerns

Scalability & Infrastructure complexity

Scalability and infrastructure management

Scalability to meet the rapidly growing demand for data processing power driven by technologies like AI and cloud computing

Security

Security and Resilience

Security Threats and Cyber-Attacks

Service and Support

Shortage of skilled professionals will also be a challenge.

Security

Security and Resilience

Security Threats and Cyber-Attacks

Service and Support

Shortage of skilled professionals will also be a challenge.

Skilled worker shortage

Space Constraints

QUESTION

### Are evolving cooling demands for ai – such as liquid cooling – leading you to consider different backup strategies? If yes, what specific approaches are you exploring? (Open end)

ANSWERS

Advanced containment strategies that prevent cooling failure by directing airflow in a controlled manner, minimizing hot spots.

Advanced Liquid Cooling with Integrated UPS

Advanced monitoring systems are crucial for keeping tabs on liquid phases, system temperature, and cooling efficiency. Al algorithms that dynamically adjust cooling efforts based on workload demand, ensuring backup systems kick in only when necessary.

Al cooling demands are driving backup strategies toward more resilient, energy-efficient infrastructure.

Al-Driven Monitoring for Predictive Maintenance

Al-powered systems Integrated Fire Suppression and Cooling

Al-powered systems that not only detect cooling faults but also automatically re-route cooling resources to backup systems.

AUN DE MOMENTO NO HAY UN PLAN EMERGENTE

QUESTION / CONTINUED

### Are evolving cooling demands for ai – such as liquid cooling – leading you to consider different backup strategies? If yes, what specific approaches are you exploring? (Open end)

ANSWERS

Backup Generators for Cooling Units

Backup heat exchangers to ensure heat can be effectively transferred even if one system malfunctions.

Backup Power for Cooling Systems

Backup storage units that have their own independent cooling solutions to ensure continued operation.

Building up systems of redundancies

Certainly, We are committing resources to modular UPS systems and generator supported cooling solutions to guarantee continuous operations in the event of cooling failures.

Combining air, liquid, and phase-change cooling methods in a hybrid approach to offer multiple layers of backup.

Consideration of coupling power design for both mechanical and electrical loads

Considering more prime power applications (e.g., onsite power generation) to meet power demands.

Considering whether UPS should cover liquid cooling CDU's--generally yes.

Conventional backup power systems, such as UPSs, are expanded to incorporate cooling system

Creating multiple cooling zones with individual backup systems to ensure localized cooling even if one zone fails. Definitely- we are really focusing on double downing on the lithium-ion batteries and continuing to expand that footprint as they seem to perform quite well

Depends on complex and reliability and warranty

Designing cooling infrastructure that can easily scale up or down with changing demands can help manage costs while ensuring adequate cooling capacity is always available.

Designing cooling system components to be hot-swappable without requiring full system downtime.

direct to chip

Direct to chip Single phase immersion

Direct-to-chip or immersion cooling systems rely on active pumps, chillers, or dielectric fluid circulation, which require power.

Dynamic Cooling Allocation

establishing hybrid cooling systems that, in the instance that liquid cooling fails to function properly, allow airflow to take over.

Exploring thermal energy storage systems to store excess cooling capacity for use when liquid cooling systems experience high demands or fail.

Free Air/Water cooling systems Liquid to the Chip Immersion cooling

Having extra liquid cooling for flexibility.

For pure HPC loads, enough backup is provided to securely shut down devices. There will need to be considerations for graceful shutdown of CDU and other components of liquid cooling to racks. Just dropping the power will not be sufficient and will cause damages. These will likely be from centralized UPS (for controls, transfer switch to genset for pumps as these are enormous loads that could not be met by a UPS).

Hybrid Backup Systems (Battery + Flywheel + Generator)

hybrid cooling system redundancy

I don't know

I think one of the specific approaches should be establishing protocols and training staff on emergency procedures for power and cooling failures.

I think there should be back up generators in a way that installing diesel or natural gas generators as a secondary power source to support cooling systems during outages.

Implementing backup cooling solutions like additional in-row cooling or supplementary liquid cooling systems to maintain consistent temperatures during high demand.

In the event of a system failure, air cooling is used as a backup to liquid cooling.

Incorporating dual-phase or redundant liquid cooling systems to maintain effective heat dissipation even if one system fails.

Incorporating fire suppression systems that also aid in cooling during emergencies, providing a dual-purpose backup.

QUESTION / CONTINUED

### Are evolving cooling demands for ai – such as liquid cooling – leading you to consider different backup strategies? If yes, what specific approaches are you exploring? (Open end)

ANSWERS

Leveraging IoT and Al-driven analytics to anticipate cooling issues and address them before they lead to system failure.

Likely. Shift to hybrid UPS systems and/or more modular power systems. Systems must handle both power failure and cooling system failures.

Liquid cooling

Liquid cooling as a more cost-effective approach

Liquid cooling backup solution

Liquid Cooling is what all DC's should be using

Liquid Cooling Redundancy Incorporating dual-phase or redundant liquid cooling systems to maintain effective heat dissipation even if one system fails.

Liquid cooling technology involves immersing servers in non-conductive liquid and circulating the liquid to dissipate heat

Liquid cooling.

liquid-cooling and UPS solutions

Local power with storage to replace partial generation from diesels

Mechanical static UPS Flywheel for mechanical equipment backup support. Continuous cooling water tanks and pumps, with UPS support.

Multi-tiered Airflow Cooling

not yet but AI and its power requirements will change the data center overall requirements

#### On chip coolina

One of the approach I will be exploring is upgrade UPS systems to handle the increase power demand from liquid cooling setup.

One of the specific approaches I could think of is to have an advanced energy storage solution. This can help to provide a reliable backup power.

One specific approach could be developing integrated systems that combine cooling and power management for greater efficiency.

One specific approach is that some are looking into integrating renewable energy sources, like solar or wind, along with battery storage. This can provide an additional layer of backup power while also being more sustainable.

Open to learning

Optimize the structural design of heat exchangers to improve heat exchange efficiency, thereby reducing the usage and energy consumption of coolant.

Optimizing backups with AI driven energy management

Optimizing backups with AI driven energy

prevents power-hungry Al workloads from consuming all available UPS energy before cooling stabilizes.

Redundant cooling system implementing backup liquid cooling systems to ensure continuous operation in case of failures.

Redundant Cooling Systems

Scalable cooling solutions that can be added or removed as needed, making backup systems more flexible.

Scaling Power Capacity: As AI workloads increase rack power density, battery backups (such as uninterruptible power supplies, or UPS) are scaled to meet higher power demands. This involves upgrading to larger capacity batteries or modular systems that can expand as needed. Redundancy and Scalability: To handle increased densities, redundancy is a critical feature. Many server racks employ N+1 or 2N configurations, ensuring continuous operation even if one UPS unit fails.

Secondary HVAC systems dedicated to cooling AI hardware, ensuring uptime if the primary system fails.

Site close to generation

Systems that automatically recover and re-distribute heat, reducing reliance on external cooling and improving energy efficiency.

Thermal Buffering

Too big a topic for such a little box. I do think you will see larger more centralized backup strategies (CUP) with larger scale facilities as repetitive/aggregate equipment designs challenge maintenance routines – just too many pieces to service!

Two-phase immersion cooling systems that operate with integrated UPS power

Under research

Unknown at this time. Too many variables for us at this time to know.

Use of distributed cooling networks across multiple sites, so a failure at one location doesn't affect the entire infrastructure.

QUESTION / CONTINUED

### Are evolving cooling demands for ai – such as liquid cooling – leading you to consider different backup strategies? If yes, what specific approaches are you exploring? (Open end)

ANSWERS

Using Al-driven analytics to optimize cooling and power usage in real time

Using Al-driven predictive analytics to detect and prevent cooling system failures before they happen.

Using dedicated backup UPS for cooling systems alongside those for the servers themselves, ensuring redundancy for both systems.

Using energy-efficient automated systems for quick response to failures, minimizing downtime. Using liquid cooling technology

We are developing backup techniques to manage AI's changing cooling demands, including redundant circuits and automated switchover to assure continuous optimal temperature management.

We are implementing backup liquid cooling loops to prevent system failure during primary cooling outages.

We have already implemented liquid cooling systems in a lot of our power supplies and will continue to improve on making our sources more reliable

We haven't considered these backup strategies yet, impact to be analyzed in future

We're basically trying to keep our computer systems cool and running smoothly while handling super-powerful AI machines that generate tons of heat.

Yes - hybrid cooling systems and AI powered cooling orchestration

Yes - more Additionally, backups and ways we can tackle ransomware

Yes ,Since water conducts heat about 30 times better than air, it is a highly efficient method of data center cooling

Yes, as liquid cooling necessitates denser UPS configurations for rapid failover.

Yes, evaluate existing equipment, consider costs and operational risks, make a gradual transition, and replace equipment

Yes, evolving cooling demands for AI, like liquid cooling, are leading to considerations of different backup strategies. Approaches include integrating UPS systems compatible with liquid-cooled environments, implementing rack-level BBUs to reduce dependency on centralized systems, transitioning to higher-efficiency batteries like LFP or LTO, prioritizing critical AI workloads during outages through dynamic load shedding, and exploring flywheel energy storage for seamless power continuity and reduced heat OU

Yes, evolving cooling demands for Al, like liquid cooling, are leading to reconsideration of backup strategies. We are exploring approaches such as modular backup systems, redundant liquid cooling loops, and hybrid cooling setups that combine traditional and advanced cooling to ensure reliability during failures.

Yes, evolving cooling demands for aluminum applications, especially in high-performance industries like electronics or manufacturing, are pushing the adoption of advanced cooling. As power densities increase, traditional air cooling might not suffice.

Yes, growing cooling demands for AI, particularly liquid cooling, are forcing us to revaluate backup plans. We're looking into redundant cooling loops, hybrid systems that combine liquid and air cooling, and improving UPS systems to assure stable power for these advanced cooling technologies during outages. The objective is to ensure cooling efficiency and system resilience.

Yes, growing cooling demands for AI, particularly liquid cooling, are forcing us to revaluate backup plans. We're looking into redundant cooling loops, hybrid systems that combine liquid and air cooling, and improving UPS systems to assure stable power for these advanced cooling technologies during outages. The objective is to ensure cooling efficiency and system resilience. Yes, exploring immersion cooling's impact on battery backup design for AI driven workloads.

Yes, I will be exploring an integrated backup solution and modular backup system in such that it allows for flexibility and scalability as cooling demands change.

Yes, liquid cooling requires robust redundancy, and we are exploring dual power sources and enhanced battery backups for continuous uptime in critical systems.

Yes, modifications in backup strategies are being driven by AI's cooling requirements. Pumps and chillers are necessary for liquid cooling. cooling can be disrupted more quickly by power outages than by air-cooled systems. Businesses are investigating UPS cooling systems. Additionally, under consideration are automated leak detection and hybrid cooling.

Yes, more AI research on cooling demands. We do not disclose the details.

Yes, providing UPS power to cooling pumps

Yes, the evolving cooling demands for AI, particularly the rise of liquid cooling, are absolutely leading to a reevaluation of backup strategies.

Yes, the shift towards liquid cooling for AI workloads is cooling, data center operators to re-evaluate their backup strategies, as liquid cooling systems present unique challenges and require different approaches to ensure redundancy and continued operations in case of failure.

Yes, with Al's growing cooling needs, like liquid cooling, we're looking into backup strategies that focus on flexible UPS systems and energy storage solutions to keep power stable and support cooling in high-density Al setups.

Yes. We are considering liquid cooling, but our strategies are still in the process of development. We also have a lot of concerns with security of Al applications.

QUESTION

### Which of the following best describes your job level? (Other responses)

ANSWERS		
Procurement Manager	Sales	Sales
QUESTION		

How do you see your ups battery backup run times changing in the future? (Other responses)

ANSWERS		
N/A	N/A	Will very to match standby generation

QUESTION

Where do you believe the potential failure points are in your existing ups backup system? (Other responses)

A N S W E R S		
deferred maintenance	N/A	Failure mitigation

QUESTION

What is the biggest impact on power requirements and energy storage technology artificial intelligence (ai) will have on your data center? (Other responses)

ANSWERS

Change in floor area use ratios

HPC loads will generally have less UPS run time or no UPS at all

# Methodology

Endeavor Business Intelligence and Data Center Frontier conducted data collection and analysis on behalf of ZincFive Inc. The data was collected from January 23 to February 6, 2025, resulting in 132 qualified survey responses. The methodology adheres to standard marketing research methods, practices, and procedures.

### About ZincFive, Inc.

ZincFive is the world leader in innovation and delivery of nickel-zinc batteries and immediate power solutions. Supported by an impressive portfolio of international patents, ZincFive technology harnesses The Power of Good Chemistry<sup>®</sup> to propel the world forward. ZincFive technology leverages the safety and sustainability of nickel-zinc chemistry to provide unparalleled high power density and performance for mission critical applications. ZincFive is a privately held company based in Tualatin, Oregon.

For more information, visit www.zincfive.com
